Introduction. A recent article states that work published by a chemistry group in The Netherlands "is interesting for origin-of-life research: apparently, you can get these complex molecules before biological evolution has started."<sup>1</sup> They discuss the synthesis of a large molecule which folded into a ring pattern with a five-fold symmetry (pentagon shape) and compared it to the folding of ...

Despite the complexity of life on Earth, the most important large molecules found in all living things can be classified into only four main categories: carbohydrates, lipids, proteins and nucleic acids. Students will explore the structure of these biomolecules as well as water, since they interact in an aqueous environment.

These four types of molecules are often referred to as the molecules of life. The four molecules of

life are proteins, carbohydrates, lipids and nucleic acids. Each of the four groups is vital for every single organism on Earth. Without any of these four molecules, a cell and organism would not be able to live.

### **Molecules of Life | Basic Biology**

One of the accepted scientific theories describing the origin of life on Earth is known as chemical evolution. According to this theory, which of the following events would need to occur first for life to evolve? A. onset of photosynthesis . B. origin of genetic material . C. Synthesis of organic molecules . D. formation of the plasma membrane
